Morbidity and Mortality

Weekly Report

PUBLIC HEALTH SERVICE U.S. DEPARTMENT OF HEALTH, EDUCATION, AND

Prepared by the

COMMUNICABLE DISEASE CENTER

MElrose 4-513

For release February 17, 1961

Allanta 22, Georgia

Vol. 10, No. 6

Provisional Information on Selected Notitiable Diseases in the United States and on Deaths in Selected Cities (Br Week Ended February 11, 1961

Influenzo - Although epidemic influenza continues to occur in Great Britain (see International Notes, page there have been no reports of influenza activity within the United States. The number of deaths due to influenza and pneumonia are within normal limits for the season (see graph, page 2).

Hepatitis - Continues at high level of incidence; total reported cases this week (1,639) does not include figures from Tennessee, which reported 161 cases last week.

EPIDEMIOLOGICAL REPORTS

Hepatitis - Mississippi

Mississippi State Board of Health, reports an outbreak of infectious hepatitis in Pascagoula, Mississippi traced to the consumption of raw oysters. Since January 1, a total of 32 cases has occurred in a population of approximately 17,500 persons. All but two were jaundiced. The incidence increased during the month to a peak of 12 cases in the week ending February 4. They were widely distributed

Figures for current week exclude missing reports from Arizona and Tennessee (State holiday)

The graph shows current pneumania-influenza deaths reparted weekly in 108 United States cities in comparison with the expected number of deaths.* No excess has accurred in recent weeks. Total deaths (see table 3) are also at normal levels. During the first six weeks of 1961 there has been a decrease of 4,872 deaths (or 6.1 percent) in 117 United States cities in comparison with deaths during the same period in 1960 when influenza epidemics were widespread.

(*The procedure for calculating expected levels is described in a mimeographed publication available on request to the Statistics Section, Epidemiology Branch, CDC).

throughout the city without apparent focal concentrations. Most of the cases were in adults, 24 of 32 being 15 years of age or older. Careful food eating histories revealed that 27 of the cases had eaten raw oysters from 20 to 40 days prior to onset. While oysters are a common article of food in this area, the eating of raw oysters is uncommon.

Attempts to trace the source revealed that 19 of the cases were associated with oysters packed in pint containers by one group of distributors who contributed only a small fraction of the total fresh oysters sold in the city. Investigation of the source of contamination of those oysters is in progress. There has been no evidence to incriminate oysters from other sources or other distributors. The outbreak has been studied and is under continuing study by State and local health department personnel of Mississippi as well as the Communicable Disease Center and the Division of Milk, Food, Interstate, and Community Sanitation of the U. S. Public Health Service.

Trichinosis - Iowa

Dr. Ralph Heeren, Director, Division of Preventable Diseases, Iowa State Department of Health, reported an outbreak of 18 cases of trichinosis during December and January distributed among five counties and related to the consumption of uncooked home prepared pork sausage. The clinical manifestations varied from mild to severe and included nausea, abdominal pain, diarrhea, periorbital edema, headache, dizziness, disturbed vision, myalgia,

weakness, chills, fever and sweats. Eosinophilia ranged from 3 to 43 percent. The diagnosis was substantiated by serologic means. Nine cases were male and nine female, and ages ranged from 2 to 74 years. Five persons who ate small quantities of raw sausage which had been frozen for a period of two weeks did not become ill.

The sources of the pork and beef used in the sausage were three large packing companies. The meat, which was ground, seasoned, packed in natural casings, and smoked for six days, was then eaten uncooked between December 8 and 26.

The sausage samples examined at the State Hygienic Laboratory contained *Trichinella spiralis*, with the average number of parasites per gram of sausage varying from 0.4 to 4.6.

Correction - Hale County, Texas, Diphtheria Epidemiological Report (Vol. 10, No. 1): Only 10 isolates from diphtheria cases occurring in the county have thus far been typed. Of these, one was mitis, and the other nine were intermedius. All isolates from Plainview have been of the latter type.

INTERNATIONAL NOTES

England and Wales

Epidemic influenza this week accounted for 1,219 deaths, almost doubling the total of last week (699), while (Continued on page 8)

The chart shows the number of deaths reported for 117 major cities of the United States by week for the current year, a 5-week moving average of these figures plotted at the central week, and an adjusted average for comparison. For each region the adjusted average was computed as follows: From the total deaths reported each week for the years 1956-1960, 3 central figures were selected by eliminating the highest and lowest figure reported for that week. A 5-week moving average of the arithmetic mean of the 3 central figures was then computed with adjustment to allow for population growth in each region. The average value of the regional increases was 2 percent which was incorporated in the adjusted average shown in the chart.

Table 4 shows the number of death certificates re-

ceived during the week indicated for deaths that occurred in selected cities. Figures compiled in this way, by week of receipt, usually approximate closely the number of deaths occurring during the week. However, differences are to be expected because of variations in the interval between death and receipt of the certificate and because of incomplete reporting due to holidays or vacations. If a report is not received from a city in time to be included in the total for the current week, an estimate is used.

The number of deaths in cities of the same size may also differ because of variations in the age, race, and sex composition of the populations and because some cities are hospital centers serving the surrounding areas. Changes from year to year in the number of deaths may be due in part to population increases or decreases.

Table 3. DEATHS IN SELECTED CITIES BY GEOGRAPHIC DIVISIONS

(By place of occurrence and week of filing certificate. Excludes fetal deaths. Data exclude figures shown in parentheses in table 4)

Figures shown in parenthesis are from cities which have been reporting less than five years and hence are not included in Table 3.

in the comparable week last year, only 36 deaths were attributed to influenza. These figures are from the Weekly Influenza Statement (No. 6) issued by the British Ministry of Health. Increases in the number of deaths due to pneumonia and bronchitis are also noted; the number of deaths due to pneumonia, influenza, and bronchitis this week totaled 5,168 as compared with 1,423 in the comparable week last year.

Dr. Edward O'Rourke, Epidemiological Consultant, Division of Foreign Quarantine, USPHS, London, reports that seventy-five percent of the deaths this week occurred in persons 65 years and older. He also reports that isolations continue to show the presence of A2 influenza virus in England; but there has been no evidence of spidemic influenza on the European Continent.

Venezuela

A report from WHO indicates the presence of plague infested rats in an area of one thousand square kilometers located south of Caracas which has been endemic for rodent plague. No human cases have been reported.

QUARANTINE MEASURES

Immunization Information for International Travel - 1960 edition

Public Health Service Publication No. 384

The following corrections should be made to the list of Yellow Fever Vaccination Centers in Section 6, page 69:

City	Center	Clinic Hours	Fee
Tennessee	Davidson County Department of	Wednesday	Yes
Nashville	Public Health, 311-23rd	by appoint-	
	Avenue, North	ment only	
	Tel. Cypress 1-5100		

CUBA - SMALLPOX VACCINATION REQUIREMENT

All travelers arriving from Cuba after January 14, 1961, will be required to show evidence of valid vaccination for smallpox. The application of this quarantine regulation to travelers from Cuba was announced January 10 by Dr. Leroy Burney, Surgeon General.

Areas exempt from quarantine are: Canada, the Canal Zone, the West Coast of Lower California, and the islands of Greenland, Iceland, the Bahama, Bermuda and British Virgin Islands, St. Pierre, Miguelon, Aruba, Curacao, and Tamaica.

SOURCE AND NATURE OF MORBIDITY DATA

These provisional data are based on reports to the Public Health Service from the health departments of each State and Puerto Rico. They give the total number of cases of certain communicable diseases reported during the week usually ended the preceding Saturday. Total figures for the United States and the Pacific Division include data for the States of Alaska and Hawaii. Cases of anthrax, botulism, and rabies in man are not shown in table 2, but a footnote to table 1 shows the States reporting these diseases. When diseases of rare occurrence are reported by a State (cholera, dengue, plague, louse-borne relapsing fever, smallpox, louseborne epidemic typhus, and yellow fever) this is noted below table 1.
